**Gevaert_SupMat_FigureS1 – High genetic diversity in Porter's sunflower (*Helianthus porteri*) – Jhered.**

**Supplementary Figure S1.** STRUCTURE analysis results with *K = 5* genetic clusters for 10 native populations and 2 transplant populations of Helianthus porteri. Bars for each individual indicate the average result across fifteen independent iterations. Each individual is represented along the x-axis, with populations presented in order of geographical location, CMR being farthest west and HR being farthest east, along the y-axis.
